Scope

The Journal of Nuclear Materials publishes high quality papers in materials research relevant to nuclear fission and fusion reactor technologies, and in closely related aspects of materials science and engineering. Both original research and critical review papers covering experimental, theoretical, and computational aspects of either fundamental or applied nature are welcome. The breadth of the field is such that a wide range of processes and properties is of interest to the readership, spanning atomic lattice defects, microstructures, thermodynamics, corrosion, and mechanical and physical properties, for example. The following list, which is not exhaustive, describes topics appropriate to the Journal.

- Fission reactor materials, including fuels, cladding, core structures, pressure vessels, moderator and control components; fission product behavior.
- Materials aspects of the fabrication and reprocessing of fuels.
- Performance of nuclear waste materials, glasses and ceramics, immobilization of wastes.
- Fusion reactor materials, including first walls, blankets, insulators, and magnets.
- Neutron radiation effects in materials, including defects, microstructures, transmutations, phase changes, and macroscopic properties.
- Interactions of plasmas, ion beams, electron beams and electromagnetic radiation with materials.

Original material: Submission of a manuscript implies it is not being simultaneously considered for publication elsewhere and that the authors have obtained the necessary authority for publication.

Types of contributions
Original research papers and critical review papers are welcome. These may be written in English, French or German. All should contain an abstract written in English and of length less than 150 words.
Rapid publication. Short papers of total length less than 2000 words may be published as Letters to the Editors in a shorter time than regular articles as the proofs will normally be checked by the Publisher. Abstracts for Letters to the Editors should be limited to 75 words.

Manuscript preparation
The paper copies of manuscripts should be prepared with double line spacing and wide margins, on numbered sheets. See notes opposite on electronic version of manuscripts.
Structure. Please adhere to the following order of presentation: Article title, Author(s), Affiliation(s), Abstract, PACS codes and keywords, Main text, Acknowledgements, Appendices, References, Figure captions, Tables.
Corresponding author. The name, complete postal address, telephone and fax numbers and the e-mail address of the corresponding author should be given on the first page of the manuscript.
References. References to other work should be consecutively numbered in the text using square brackets and listed by number in the Refence list. Please refer to a recent issue of the journal for examples.

Figures
Figures should also be submitted in duplicate: one master set and one set of copies. The *line drawings* in the master set should be original laser printer or plotter output or drawn in black india ink, with careful lettering, large enough (3–5 mm) to remain legible after reduction for printing. The *photographs* should be originals, with somewhat more contrast than is required in the printed version. They should be unmounted unless part of a composite figure. Scale markers must be inserted on the photographs.
Colour plates. Figures may be published in colour, if this is judged essential by the editor. The publisher and the author will each bear part of the extra costs involved. Further information is available from the publisher.

Classification codes/keywords
Please supply one to four classification codes (PACS and/or MSC). See the advertisement in the final pages of this issue for further details on where to find these lists.

After acceptance
Notification. You will be notified by the Editor of the journal of the acceptance of your article and invited to supply an electronic version of the accepted text. The Editors will assign key words to manuscripts according to a subject index especially prepared for the Journal.
Copyright transfer. In the course of the production process you will be asked to transfer the copyright of the article to the publisher. This transfer will ensure the widest possible dissemination of information.
Proofs. When the page proofs of the accepted manuscript are made and sent to authors, this is in order to check that no undetected errors have arisen in the typesetting (or file conversion) process. Only printers' errors may be corrected; no changes in, or additions to, the edited manuscript will be accepted. In case of extended changes, the authors will be required to pay part of the extra costs involved.

Electronic manuscripts
The publisher welcomes the receipt of an electronic version of your accepted manuscript. Authors are requested to submit an electronic version of their manuscript to the Editor along with a paper copy. Most manuscripts require revision after refereeing; the electronic version should be included for the first time when the revised copy is submitted to the Editor. See the advertisement in the final pages of this issue for further details. Please note that no deviations from the version accepted by the Editor of the journal are permissible without the prior and explicit approval by the Editor. Such changes should be clearly indicated on an accompanying printout of the file.

Author benefits
No page charges. Publishing in Journal of Nuclear Materials is free.
Free offprints. The corresponding author will receive 50 offprints free of charge. An offprint order form will be supplied by the publisher for ordering any additional paid offprints.

Dislocations in Solids, Volume 10

$L1_2$ Ordered Alloys

edited by **F.R.N. Nabarro** *and* **M.S. Duesbery**

A substantial part of this volume is devoted to the plastic properties of alloys having the ordered $L1_2$ structure, typified by Ni_3Al. These structures are of engineering importance because they form an essential constituent, and in modern alloys, the major constituent, of superalloys.

The volume opens with a historical introduction by one of the pioneers of the subject who had already observed the anomalous temperature dependence of these structures in 1967. The following chapters deal with a variety of aspects of these alloys including the dislocation arrangements which are revealed by transmission electron microscopy; the anomalous plastic properties of these alloys, especially the positive temperature dependence of flow stress to the structure of the dislocation cores; the theory which considers the way in which dislocations in $L1_2$ become pinned at certain points and the way in which these pinning obstacles can be overcome; the link to the theory of phase transitions. This part of the book ends with a discussion paper on a model which, the authors claim, puts too much emphasis on the anisotropy of the flow stress and too little on other observations. The final two chapters deal with: the effects of electronic excitation on the plasticity of semiconducting crystals and the role of dislocations in melting, exploiting the old idea that the presence of small dislocation loops in thermal equilibrium reduces the energy required to form more loops, so leading to a first-order phase transition.
